## Interview Questions

**1. What is the major difference between tuples and lists in Python?**

**Answer:** There are several major differences between tuples and lists in Python, which include the following:

### Tuples

- Tuples are similar to a list, but they are enclosed within parenthesis, unlike the list.

- The element and size can be changed.
- They cannot be updated.
- They act as read-only lists.
- Tuples are surrounded by ( )
- Example of Tuple Code is, `tup = (1, "a", "string", 1+2)`

## Lists

- The list is used to create a sequence.
- The element and size cannot be changed.
- They can be updated.
- They act as a changeable list.
- Lists are surrounded by [ ]
- Example of Lists Code is, `L = [1, "a", "string", 1+2]`

## 2. What is a commit message, and how is the commit command executed?

**Answer:** The commit command is executed in a Git project to record the progress in the local repository. The commit command is executed only after the files to be committed have been added to the staging area using the git add command.

The command that makes it possible to write a commit message is 'git commit -m'.

## 3. What is the difference between git fetch and git pull?

**Answer:**

- Git fetch retrieves new data from a remote repository but does not integrate it into our working files. It helps in checking if any changes happened in the remote repository. It does not manipulate or destroy anything in the process.
- Git pull, on the other hand, updates the HEAD with the latest changes from the remote server and directly integrates it into the working copy files. Using git pull can end in merge conflict as it tries to merge remote changes with the local ones.
